Medical modeling, sometimes called biomodeling, is the creation of highly accurate physical models of human anatomy directly from medical scan data. The process involves capturing human anatomy data, processing the data to isolate individual tissue or organs, optimizing the data for the technology to be used, and finally building the model using Rapid Prototyping [“RP”] techniques.

The medical model of mental illness treats mental disorders in the same way as a broken arm, i.e. there is thought to be a physical cause. This model has been adopted by psychiatrists rather than psychologists. Supporters of the medical model consequently consider symptoms to be outward signs of the inner physical disorder and believe that if symptoms are grouped together and classified into a ‘syndrome’ the true cause can eventually be discovered and appropriate physical treatment ...
